

The diagrammatic equation is as follows:

$$\begin{aligned}
 & \text{Diagram 1} + \text{Diagram 2} + \text{Diagram 3} + \text{Diagram 4} = \text{disc}_{p_1^2} \text{disc}_{p_2^2}
 \end{aligned}$$

Detailed description of the diagrams:

- Diagram 1:** A box diagram with two vertical blue lines and two horizontal orange lines. A wavy line connects the two vertical lines, and a straight line connects the two horizontal lines. Momenta are labeled p_1 , p_2 , and k .
- Diagram 2:** A box diagram with two vertical blue lines and two horizontal orange lines. A wavy line connects the two vertical lines, and a straight line connects the two horizontal lines. Momenta are labeled $k - p_1$, k , and p_2 .
- Diagram 3:** A box diagram with two vertical blue lines and two horizontal orange lines. A wavy line connects the two vertical lines, and a straight line connects the two horizontal lines. Momenta are labeled p_1 , k , and $k - p_2$.
- Diagram 4:** A box diagram with two vertical blue lines and two horizontal orange lines. A wavy line connects the two vertical lines, and a straight line connects the two horizontal lines. Momenta are labeled $k - p_1$, k , and $k - p_2$.
- Right-hand side:** The product of two disc operators, $\text{disc}_{p_1^2}$ and $\text{disc}_{p_2^2}$, represented by two separate diagrams. Each disc operator consists of a vertical red line and a wavy line connecting it to another vertical red line.
