

The image displays a sequence of four Feynman diagrams, each representing a term in a sum, followed by an equals sign and the product of two disc integrals, $\text{disc}_{p_1^2} \text{disc}_{p_2^2}$. The diagrams are separated by plus signs.

- Diagram 1:** A box diagram with two vertical blue lines and two horizontal orange lines. A red vertical line is in the center. External momenta p_1 and p_2 enter from the left, and p_1 and p_2 exit to the right. Internal lines are solid, with wavy lines connecting the top and bottom vertices.
- Diagram 2:** Similar to Diagram 1, but with the top and bottom vertices crossed, and the wavy lines connecting the left and right vertices.
- Diagram 3:** Similar to Diagram 1, but with the top and bottom vertices crossed, and the wavy lines connecting the top and bottom vertices.
- Diagram 4:** Similar to Diagram 1, but with the top and bottom vertices crossed, and the wavy lines connecting the top and bottom vertices.

The sum of these four diagrams is equal to the product of two disc integrals, $\text{disc}_{p_1^2} \text{disc}_{p_2^2}$. To the right of the equation is a diagram of a disc integral, which is a circle with a red dot in the center. A red line connects the center to the top of the circle. The disc is labeled with p_1 and p_2 at the top and bottom, and k at the right.
