

The image displays a sequence of Feynman diagrams representing a mathematical identity. It begins with the sum of four terms, each featuring a central wavy line (representing a photon or gluon) and two vertices (represented by blue and orange circles). The vertices are connected by straight lines (representing fermions). The first term shows the wavy line connecting the two vertices in a direct manner. The subsequent three terms show the wavy line connecting the vertices in a more complex, crossed manner. The second and fourth terms have additional labels $k - p_1$ and $k - p_2$ on the fermion lines. The third term has labels $k - p_1$ and $k - p_2$ on the wavy line. The fourth term has labels $k - p_1$ and $k - p_2$ on the fermion lines. The sum of these four terms is equated to the product of two disc diagrams, $\text{disc}_{p_1^2} \text{disc}_{p_2^2}$, which are shown as two separate wavy lines connected by a central vertex.

$$\begin{aligned}
 & \text{Diagram 1} + \text{Diagram 2} + \text{Diagram 3} + \text{Diagram 4} = \text{disc}_{p_1^2} \text{disc}_{p_2^2}
 \end{aligned}$$
