

The diagram illustrates a sum of four Feynman diagrams on the left, followed by an equals sign and the product of two disc terms, $\text{disc}_{p_1^2} \text{disc}_{p_2^2}$, and finally a diagram representing the sum of two crossed terms.

The four diagrams in the sum are:

- A diagram with two vertical blue lines and a central red vertical line. The left blue line has incoming momenta p_1 (top) and p_2 (bottom). The right blue line has outgoing momenta p_1 (top) and p_2 (bottom). A wavy line with momentum k connects the two blue lines, passing through the red line.
- A diagram with two vertical blue lines and a central red vertical line. The left blue line has incoming momenta $k-p_1$ (top) and p_2 (bottom). The right blue line has outgoing momenta $k-p_1$ (top) and p_2 (bottom). A wavy line with momentum k connects the two blue lines, passing through the red line.
- A diagram with two vertical blue lines and a central red vertical line. The left blue line has incoming momenta p_1 (top) and $k-p_2$ (bottom). The right blue line has outgoing momenta p_1 (top) and $k-p_2$ (bottom). A wavy line with momentum k connects the two blue lines, passing through the red line.
- A diagram with two vertical blue lines and a central red vertical line. The left blue line has incoming momenta $k-p_1$ (top) and $k-p_2$ (bottom). The right blue line has outgoing momenta $k-p_1$ (top) and $k-p_2$ (bottom). A wavy line with momentum k connects the two blue lines, passing through the red line.

The sum of these four diagrams is equal to the product of two disc terms, $\text{disc}_{p_1^2} \text{disc}_{p_2^2}$, which is represented by a diagram showing two crossed wavy lines with momenta k and $k-p_1$ and $k-p_2$.
